What's New in Mailit 6

Mailit 6 is a FileMaker 10-15 plug-in for Windows and Mac OS X that integrates full email capability into your FileMaker 10-15 solutions with ease.

Mailit 6 brings the following enhancements over Mailit 5. For a full list of Mailit 6 features see:
http://www.dacons.net/fmplugins/mailit6

New functionality was integrated seamlessly into existing product design, so only a few new functions were added. Instead, existing functions have been extended. The following is a highlight of new functionality introduced in Mailit 6.

Threaded Receiving

- Mailit 6 provides a Threaded Receiving support, which allows receiving messages in the background, leaving the FileMaker application accessible for other operations. Please notice that sample files demonstrating the Threaded Receiving technique use the `"Emai_PerformScript"` function to initiate the script execution after network operation are complete. This function cannot be used on Server side. Instead `"Emai_GetThreadQueueItemsNumber"` function can be used to find out if the thread queue has been exhausted.
  For solutions running on FileMaker Server it is recommended to use non-threaded approach for both sending and receiving operations.

Additional Improvements

- Mailit 6 is includes x64 code which provides FileMaker Server 13-14 compatibility.
